Pearson Medical Technologies, LLC (PMT) manufactures and markets the intelliPACK® Automated Unit Dose Packaging System and M:print® Bar Code Labeling Software. PMT's mission is to provide innovative, practical, and affordable pharmacy automation and information technology to pharmacy professionals that will enhance productivity and safety. PMT serves its customers in hospital and long-term care pharmacies by providing new and well-engineered solutions that help pharmacists better serve their customers.

M:print® Bar Code Labeling Software. M:print® is the only stand-alone bar code label printing software specifically designed for use by any hospital or long-term care pharmacy. M:print® can produce bar codes on many types of labels. M:print® uses a drug name, NDC number, and image database by First Databank® and "Scan-and-Print" technology to retrieve label templates and drug specific information by simply scanning the medication bottle's bar code, reducing labeling errors. All versions of M:print® and intelliPACK® 2 incorporate the same unique software features.

M:print® Labeler allows pharmacies to produce self-adhesive bar code labels for all medications, from oral solids to ampoules, vials, and pre-filled syringes. This system can be the entire bar code labeling solution for a small hospital, or can complement advanced systems used by hospital pharmacies or long-term care pharmacies. All versions of M:print® feature over 8,000 pill images (for enhanced safety), TALL MAN lettering, on-screen pharmacist approval, universal label configuration options, multiple label templates, and multi-variable reports.

clearTag® Labels are custom labels designed by Pearson Medical for use with all versions of M:print® to allow pharmacists to place bar code labels on hard to tag items, such as syringes, vials, and ampoules and still clearly read the manufacturer's information. clearTag® Labels are on a roll, not a sheet, enabling pharmacists to print only the specific number of labels needed to bar code items in stock – no wasted labels!

M:print® Strip Packager is designed to work with the Euclid Cadet® series of unit dose strip packagers. M:print® improves the functionality and safety of Euclid® packagers by providing a drug name, drug code, and pill image database, unique "Scan-and-Print" technology, enhanced reports, and clear, intuitive user interface. Another version of M:print® — now available — incorporates Strip Packager with Labeler to completely fulfill all the unit dose bar coding requirements of the pharmacy.

intelliPACK®2 Automated Unit Dose Packaging System is an affordable solution for pharmacy packaging of bar coded unit dose and multi-dose medications. PMT will complete integration of IP2 in August 2006 and will officially launch the IP2 in December 2006 at the ASHP Midyear Clinical Meeting. The intelliPACK® system is designed to allow fast, unattended packaging.
